Property Rental System – Assumptions and Further Information

Student: Ria Bansal – 34267433

Assumptions Made

1. A RENTAL entity has been introduced as a bridging entity to record each instance of a tenant renting a property. Its composite key consists of `tenant_no` and `prop_no` as the scenario states "each rental recorded is by a particular tenant for a particular property."
2. The DAMAGE entity uses a composite key of `tenant_no`, `prop_no` and `damage_date` as no damage number is mentioned in the scenario, and surrogate keys are not permitted.
3. `payment_no` is retained as the key for PAYMENT as the scenario explicitly states "each payment is assigned a unique payment number" — this is a natural business key, not a surrogate key.
4. The contact address attributes (street, city, state, postcode) are recorded for the tenant arranging the rental only, as explicitly stated in the scenario.
5. Sub-properties are treated as properties in their own right with their own `prop_no` as stated in the scenario. No additional attribute is needed to record the parent property as the scenario does not explicitly require this to be stored.
6. `payment_account_type` has three possible values: Rental, Bond or Damage, as explicitly listed in the scenario.
